

Predicted GO (LEA) vs Survival at Final Time Point

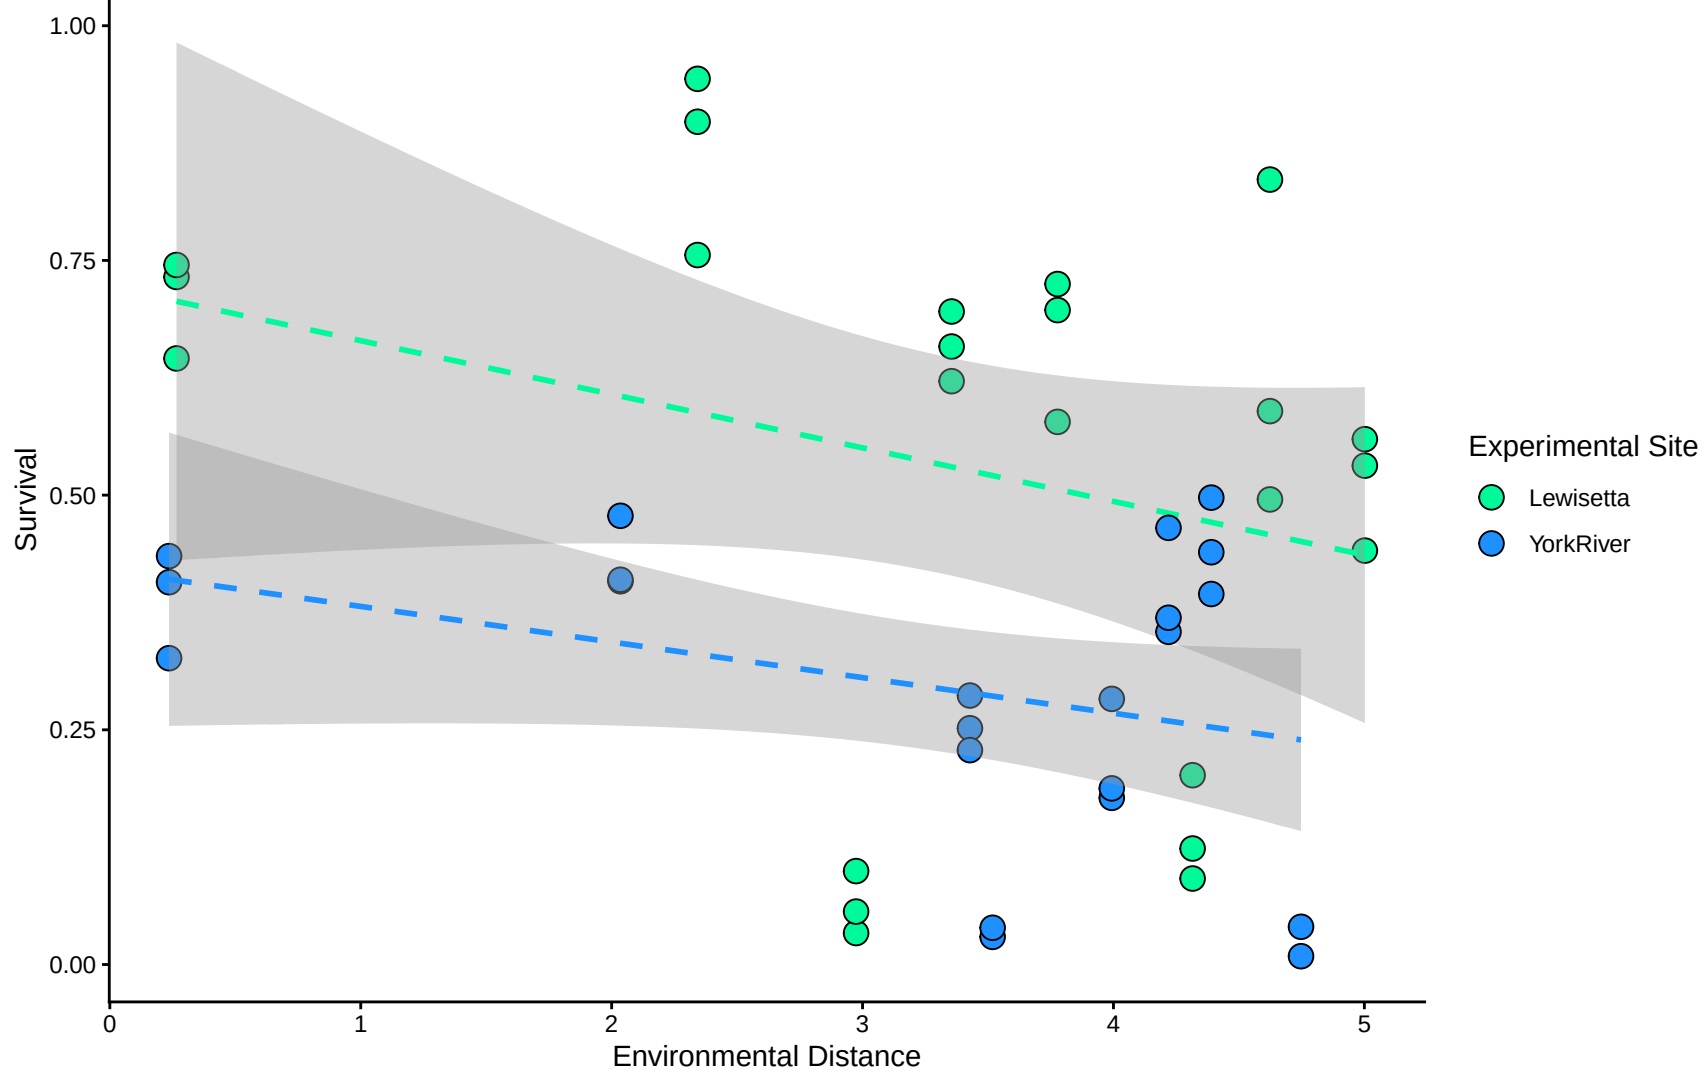

A scatter plot showing the relationship between GF Offset (x-axis, ranging from 0.000 to 0.020) and GF Bias (y-axis, ranging from -0.005 to 0.005). The plot displays two groups of data points: green circles and blue circles. Each group has a corresponding linear regression line and a shaded gray confidence interval. The green group shows a negative correlation, with a solid green regression line and a shaded gray confidence interval. The blue group also shows a negative correlation, but with a dashed blue regression line and a shaded gray confidence interval. The green group's data points are generally higher on the y-axis than the blue group's data points. The regression lines for both groups are downward sloping, indicating that as GF Offset increases, GF Bias decreases for both groups.
